Affirmation

Hereby I affirm that I wrote this diploma thesis without any inadmissible help by a third party and without using any other means than indicated. Thoughts that were taken directly or indirectly from other sources are indicated as such.

The realization of this thesis involved a lot of time, people, energy, money, joy and despair. The period of time in which this study developed was shaped by very beautiful and extremely difficult personal experiences. Thus, apart from being an exciting scientific research project, for me personally this thesis is a result of an intensive and highly important personal learning process which I am very glad to have experienced. Many, many individuals gave scientific advice and personal support during this time, and my warmest thanks go to all of them. Special thanks go to my friends and my family.

It was only the support and enthusiasm of some people that made this study possible. At this point I would like to thank Dr. Jan Barkmann, for his help with the development of the research idea, countless positive hints and corrections, neverending assistance and patience. Equally, I want to to express my deep gratitude to Arturo Kunstmann, who made every effort to facilitate my study preparations, field work and writing process – tu energía, tus ideas y tu entusiasmo me inspiraron muchísimo, y sin ti no hubiera sido posible realizar muchas partes de este proyecto. Many thanks also go to Prof. Dr. Gerhard Gerold, for his unconditional support for the realization of this study. Likewise, I am very grateful to Prof. Dr. Jorge Czajkowski, who encouraged this project from the very beginning, received me in his research lab in La Plata and made many helpful comments regarding the energy calculations in this study – ¡muchas gracias!

During my study preparations I received manifold expert help. For positive suggestions and encouragement I would like to thank in particular Prof. Dr. Peter Obert, Jennifer Romero, Andrés Plaza, Dr. Claudia Cerda, Dr. Tilo Stroh and Dr. Ralph Chapman.

My field work was accompanied by exciting moments, difficult situations, magnificent landscapes, great challenges and wonderful people. First I want to express my thanks to María de la Paz, Mariela Marcilese, Belen Salvertti and all of the LAyHS team for a hearty welcome in Argentina. Fanny Pino and the CERE team warmly received me in Punta Arenas – justedes hicieron todo para que me siente cómoda! A crucial role for my work on Navarino Island played its inhabitants willing to participate in my interviews and allowing me to conduct temperature measurements in their buildings. Furthermore, my thanks go to Miguel Gallardo from CONAF, to the local municipality and especially to Governor Nelson Carcamo – su interés en el proyecto y su ayuda me motivaron mucho. At this point I would also like to thank Peter Schmohl from GASCO Magallanes who enabled the realization of thermal

retrofits at a Navarino building during my stay on the island. The University of Magallanes provided a workplace in Puerto Williams, and the Omora team gave support in many different ways – ¡muchísimas gracias! A heartfelt gratitude also goes to Patita Ureta who made me feel home at the 'fin del mundo' – en tu casa pude vivir como si fuera la mía. And Juan: no voy a olvidar que tan importante fuiste antes y durante mi tiempo en Chile, aunque al final todo salio muy distinto de lo que imaginábamos. My time in South America was perfectly rounded up by a visit at Alejandro Gonzalez' creative energy-efficient house in Bariloche – ¡un gusto enorme haberte conocido!

Back in Germany, an amazing person came into my life and made everything much easier. Payamor, Tatita!! Para mi tesis tu opinión crítica me sirvió de mucha ayuda. Hendrik was extremely supportive during the first and most difficult phase of the writing process. Steffen gave competent advice regarding the investment analysis. Georg and Maren helped during uncounted hours with the layout and formatting, read the entire manuscript and gave very helpful feedback. Ein riesengroßes Dankeschön! My thanks also go to Malte for proofreading parts of the thesis and to Hannes for designing the cover.

Finally I would like to thank the DAAD for the financial support that enabled this project.

Göttingen, December 2011

Anja Banzhaf

Despite harsh climate conditions, the majority of residential buildings in the extreme south of Chile lack suitable thermal insulation. Thus, energy consumption for space heating is high, and buildings are frequently characterized by uncomfortable and unhealthy indoor environments. Fuel wood plays a fundamental role as combustible for heating in southern Chile, and fuel wood extraction often causes or contributes to the degradation of local primary forests. Thus, there is a conflict between the protection of the diversity and integrity of Patagonian forest ecosystems and the use of wood as a locally available resource for space heating.

The principal aim of this study is to analyze whether this conflict could be reduced with 'basic' thermal insulation in residential buildings on Navarino Island. The thesis contains two related parts: First, the testing of several hypotheses regarding the impact of 'basic' thermal insulation on the fuel wood demand of Navarino residential buildings. Second, a set of wider observations that contribute to additional related research questions. The key hypotheses argue that it is possible to identify profitable thermal insulation measures for Navarino Island residential buildings, and that with these 'basic' measures more than 30% fuel wood savings can be achieved per building. If higher fuel wood demand reductions are to be reached, I hypothesize that considerable financial means are necessary.

In order to test the hypotheses, indoor temperature and humidity measurements were conducted, and possible fuel wood savings and profitability of 'basic' thermal insulation measures are calculated. In addition, local inhabitant perceptions of thermal building quality and comfort and their willingness to invest into building retrofits are examined. To answer further research questions, this study is set into the context of the Environmental Kuznets Curve for deforestation, and discussed in relation to general considerations about energy efficiency, fuel poverty, and the rebound effect.

The results of my research clearly show that the majority of Navarino civil residential buildings is insufficiently insulated. Despite high fuel wood consumption, indoor temperatures are low and indoor humidity is high. Navarino inhabitants perceive this living environment as uncomfortable; however, investments into thermal building insulation are not their priority. Thus, subsidies are required for speeding up the implementation of thermal building retrofits on Navarino Island.

Depending on underlying assumptions, up to 45% fuel wood savings per building are possible due to 'basic' thermal insulation measures. However, a considerable proportion of potential energy savings is expected to be offset by the rebound effect (e.g. due to the increase of indoor temperatures). Hence, 'basic' thermal building retrofits can lead to the increase of energy services, improve inhabitant health and well-being, and moderately reduce the fuel wood demand. For the achievement of higher fuel wood savings, far more complex energy efficiency measures and consumer education and information are necessary.
