Influence of strain path changes during cup drawing on the twinning activity in TWIP steels investigated by electron channeling contrast imaging

“Influence of strain path changes during cup drawing on the twinning activity in TWIP steels investigated by electron channeling contrast imaging”

Von der Fakultät für Georessourcen und Materialtechnik
der Rheinisch-Westfälischen Technischen Hochschule Aachen

zur Erlangung des akademischen Grades einer

Doktorin der Ingenieurwissenschaften

genehmigte Dissertation

vorgelegt von

Diplom-Ingenieurin Nahid-Nora Elhami

aus Eckernförde

Berichter: Professor Dr.-Ing. Dierk Raabe
PD Dr.-Ing. Stefan Zaefferer
Univ.-Prof. Dr.-Ing. Wolfgang Bleck

Tag der mündlichen Prüfung: 07. Juli 2017

Berichte aus der Materialwissenschaft

Nahid-Nora Elhami

**Influence of strain path changes during cup drawing
on the twinning activity in TWIP steels investigated
by electron channeling contrast imaging**

Für Irma und Farzan.

Acknowledgements

While writing this acknowledgement I was reminded again of the great time I had at the Max-Planck-Institut für Eisenforschung; a profoundly scientific and at the same time always cooperative and helpful atmosphere. I am sincerely grateful for this phase of my life and would like to thank all who contributed to it:

Dr. Stefan Zaefferer for being a dedicated teacher and supervisor, for his scientific guidance, his trust, assistance and encouragement over all the years and additionally for all the non material science related discussions.

Professor Dierk Raabe for creating this excellent place to work, giving me the opportunity to be part of it and his advice throughout the years.

Professor Wolfgang Bleck not only for being the reviewer and examiner of my work but also for all the lessons during my studies which were the fundament for this work.

thyssenkrupp Steel Europe AG for funding this work and to Dr. Harald Hofmann and Dr. Ingo Thomas for their scientific and practical support and the efficient workshops and discussions on hydrogen embrittlement.

Monika Nellessen and Katja Angenendt for their valuable help with the microscopy. Achim Kuhl for his time and help whenever IT support was needed. Herbert Faul for the mechanical tests, Alex Kostka and Erika Bartsch for the TEM Analysis, and Kemal Davut for his support with the simulation. This work couldn't have been done without their friendly help.

Anahita Khorashadizadeh for always being there, no matter if technical discussions, help with the microscope or just for a talk. Maitena Dumont, Nima Hamidi, Emad Scharifi, David Steinmetz, Helene Knoll, Olga Dmitrieva, Clara Herrera, Denny Tjahjanto, Duancheng Ma, Claudio Zambaldi, Farangis Ram, Tom Jäpel, Jiali Zhang and many more for not only being great colleagues but also for spending - not a few - cheerful moments in Düsseldorf together. Pegah Darmani, Fatemeh Aminzadeh, Maziar Khodaei and Simone Karsten for their friendship and encouragement.

And my family, Farzan for always believing in me and Irma for also sharing her moments of doubt. Both were essential for my motivation. Omid for his ironic view. And Afshin for all his patience.

Table of Contents

Chapter 1	General introduction and scope of the thesis.....	1
Chapter 2	Progress in the practical application of electron channeling contrast imaging (ECCI)	5
2.1	Background information on the evolution of the ECC imaging technique	5
2.2	Theoretical fundamentals of ECC imaging	7
2.2.1	Bragg diffraction and Bloch wave model	7
2.2.2	Intensity profiles of crystal defects	9
2.3	Experimental procedure	11
2.3.1	Sample preparation	11
2.3.2	Microscope setup for controlled electron channeling contrast imaging	12
2.3.3	Tools for orientation determination and crystallographic analysis	13
2.4	Results and discussion	15
2.4.1	Dislocation imaging by means of ECCI	15
2.4.2	Stacking fault imaging by means of ECCI	21
2.4.3	Coherent phases resolved by ECCI	25
2.4.4	Direct comparison of ECC images and TEM micrographs	27
2.5	Conclusion.....	31
Chapter 3	Deformation of TWIP steels in experiments with strain path change	33
3.1	Theoretical background	33
3.1.1	High manganese steels	33
3.1.2	Deformation mechanisms in fcc structures	36
3.1.3	Work hardening	44
3.1.4	Cup drawing process	49
3.2	Experimental approach	53
3.2.1	Test material	55
3.2.1	Simulation of cup drawing test	56
3.2.1.1	Channel die - plane strain compression	57
3.2.1.2	Three point bending	58
3.2.2	Electron backscatter diffraction	60
3.3	Results	63
3.3.1	Methods for data analysis	63
3.3.2	Biaxial plane strain compression tests	68
3.3.2.1	Mechanical data	68
3.3.3	Microstructure evolution	72
3.3.4	Bending - Unbending	77
3.3.4.1	State 1: Bending and unbending of the non-pre-strained material	77
3.3.4.2	State 2: Bending and unbending of the -0.07 pre-strained material	88
3.3.4.3	State 3: Bending and unbending of the -0.2 pre-strained material	96
3.3.4.4	Bending - Unbending in X40MnAlSi20-1.5-1	105

3.4	Discussion	109
3.4.1	Deformation mechanisms of single grains in polycrystals.....	109
3.4.1.1	Microstructure evolution	110
3.4.1.2	Orientation dependence	112
3.4.1.3	Correlation of hardening behavior and twinning.....	115
3.4.2	Pre-strained grains (strain path change).....	118
3.4.2.1	Deformation mechanisms	119
3.4.2.2	Orientation dependence	122
3.4.3	Recrystallized and pre-deformed grains in the reverse deformation	126
3.4.3.1	Deformation mechanisms (Detwinning).....	126
3.4.3.2	Grain orientation spread	132
3.4.4	Critical structures for hydrogen embrittlement.....	136
3.5	Conclusion.....	139
References.....		142
Summary.....		155
Zusammenfassung.....		157
