Editor's preface

The series *Research Reports from the Institute of Gas Turbines and Aerospace Propulsion* accounts for the advances made in turbomachinery research and development at Technische Universität Darmstadt. Because of the strong application oriented focus of the research in this area, the academic problems reflect actual industrial development trends.

The current development foci adapt to the changing political, economic and ecological framework which keeps carrying the turbomachine towards the border of technological feasibility. In consequence, it is not unusual for findings to be transferred to the industrial application directly.

It is within this environment, that the industry and application oriented research works of this series originate. The reports describe current findings of experimental investigations and numerical simulations which were obtained at the Institute of Gas Turbines and Aerospace Propulsion at Technische Universität Darmstadt.

Abstract

This dissertation describes the aeroelastic results obtained with a state-of-the-art research compressor representative to the high pressure compressor front stage of a modern twin-shaft turbofan engine.

The 1.5-stage compressor with blisk rotor was designed jointly by Rolls-Royce and TU Darmstadt as technology demonstrator for secondary flow control. In the present context, the 1.5-stage compressor is investigated with different tip clearance sizes as well as advanced casing treatment. In order to resolve the fluid-structure interaction behind the encountered blade vibrations, the compressor is heavily instrumented with unsteady wall-pressure transducers, blade mounted strain gauges and capacitive blade tip clearance/blade tip timing sensors.

This dissertation focuses on the aeroelastic behavior of the blisk rotor in the high back-pressure region. In particular, flutter and a self-excited rotating instability are investigated. It is shown for both phenomena that the aeroelastic link establishes at blade tip between periodic blade motion and fluctuating tip flow. In both cases, a backward traveling aerodynamic wave couples with a forward traveling blade vibration. The crucial role of the blade tip clearance and the flow leaking across blade tip is clearly exhibited. Both gain additional relevance from the observation that a 10% variation in local tip clearance may cause individual blade vibration amplitudes to vary by a factor of two.

Flutter and self-excited rotating instability occur at design speed with transonic rotor relative inflow as well as in the subsonic part speed region. Circumferential wave speed and wave Mach number of the backward waves are identified as common link between the blade vibration events at different compressor speeds with seemingly arbitrary active nodal diameter. It is further shown that the vibration wave Mach number correlates with the circumferential Mach number of a rotating stall cell at identical speed with nominal variable inlet guide vane setting.

Finally, the dissertation proves that the aeroelastic coupling can be broken up and high amplitude blade vibration can be prevented by either a reduction in average tip clearance or by aerodynamic mistuning through advanced casing treatment. The negation of this final conclusion implies that an increase in tip clearance due to transient operation, rub-in or component wear may lead to the onset of blade vibrations not encountered with nominal clearance. The dissertation thus clearly points out that blade vibration analyses have to be robust enough to cover the compressor's entire life cycle.

Table of contents

Nomenclature	IX
List of figures	XV
List of tables	XIX
1 Introduction	1
2 Problem statement	7
3 Fundamentals	11
3.1 Foreword to the <i>Fundamentals</i> section	11
3.2 Gas turbine layout and cycle	12
3.2.1 The gas generator - heart of any gas turbine	12
3.2.2 Motivation for global design trends	16
3.3 Axial compressors	18
3.3.1 Axial layout	18
3.3.2 Multistage layout	19
3.3.3 Euler equation	20
3.3.4 Transonic layout	23
3.3.5 Secondary flow in axial compressors	26
3.3.6 3D-design of axial compressor rotors	29
3.3.7 Compressor performance and operation	31
3.4 Blade tip clearance	36
3.4.1 Transient variation of the global tip clearance	37
3.4.2 Tip clearance variations of the individual blades	39
3.5 Blade vibration	42
3.5.1 Inferior damping of rotors	42
3.5.2 Relation of mean and alternating stresses	43
3.5.3 Blade eigenmodes	45
3.5.4 Campbell diagram	48
3.5.5 Nodal diameters and traveling waves	51
3.5.6 Mistuning	55

4	Flow induced blade vibration	57
4.1	Need for a new categorization of flow induced blade vibration	57
4.2	Novel categorization of flow induced blade vibration	59
4.2.1	Synchronous vibration	60
4.2.2	Non-synchronous vibration	61
5	Test rig, test compressor and transient experiments	67
5.1	TU Darmstadt Transonic Compressor Test Rig	67
5.1.1	Research background	68
5.1.2	Research facility	69
5.2	Transonic research compressor V1R5S3	69
5.3	Aerodynamic performance instrumentation	71
5.4	Instrumentation for aeroelastic experiments	72
5.4.1	Rotor strain gauges (SG)	72
5.4.2	Blade tip clearance / blade tip timing (BTC/BTT)	74
5.4.3	Fast response wall pressure transducers (WPT)	75
5.5	Investigated configurations	76
5.5.1	Reference clearance	77
5.5.2	Large clearance	77
5.5.3	Non-axisymmetric casing treatment	77
5.5.4	Blade tip clearance comparison	77
5.6	Rotor 5 blisk with one locally damaged rotor blade tip	79
5.7	Transient experiments	80
5.7.1	Experimental procedure	80
5.7.2	Determination of the transient aerodynamic performance	82
5.7.3	Determination of active blade mode and nodal diameter	82
6	Experimental results	84
6.1	Overview of the stability limits	84
6.2	Identification of the limiting phenomena	86
6.2.1	M2 flutter	86
6.2.2	Rotating stall	89
6.2.3	Rotating instabilities	90
6.2.4	M1 flutter	93
6.2.5	NASCT resonance followed by rotating stall	96
6.3	Aeroelastic sensitivity to transient blade tip clearance variations	100
6.4	Coupling mechanism	104
6.4.1	Role of the tip leakage flow	104
6.4.2	Tip flow fluctuation and unsteady blade force	108
6.4.3	Evolution of the traveling waves	113

6.4.4	Coupling of aerodynamic and structural traveling waves	118
6.4.5	Summary of the coupling mechanism	121
6.5	Countermeasures	123
6.5.1	Reduction of tip flow unsteadiness	124
6.5.2	Aerodynamic mistuning through NASCT	127
6.5.3	Limitations of countermeasures	129
6.6	Aeroelastic impact of real geometry effects	130
6.6.1	Inhomogeneous rotor blade tip clearance	130
6.6.2	Local blade damage	135
6.6.3	Impact on individual blade vibration amplitudes	137
6.7	Global assessment of the experimental results	142
6.7.1	Critical speeds related to non-synchronous vibration	142
6.7.2	Wave speed	143
6.7.3	Wave Mach number	147
6.7.4	Evaluation	150
7	Conclusion	152
7.1	Summary	152
7.2	Outlook	158
7.2.1	Deepening the insight	158
7.2.2	Extending the scope	159
7.3	Acknowledgement	161
8	Appendix	A1
8.1	Globally averaged concentration of greenhouse gases	A1
8.2	Turbojet and turbofan thrust	A2
8.3	Turbojet and turbofan h-s-diagrams	A3
8.4	Relation of adiabatic and polytropic compressor efficiencies	A6
8.5	Historical aspects concerning the stage pressure ratio	A6
8.6	Amendment to blade tip clearance	A8
8.7	Amendment to flow induced vibration	A11
8.8	Amendment to critical NSV-related speeds	A15
8.9	Amendment to aeroelastic instrumentation	A17
8.9.1	Unsteady casing instrumentation	A17
8.9.2	Radial pressure transducer array	A22
8.10	Amendment to aerodynamic performance instrumentation	A23
8.11	Amendment to FUTURE compressor	A25
8.12	Amendment to experimental results	A26
8.12.1	Large clearance (LC)	A28
8.12.2	Reference clearance (RC)	A39
