Numerical 3D simulation of unsteady cavitating flow in low specific speed centrifugal pumps and analysis of the NPSH characteristics and void structures

Numerical 3D simulation of unsteady cavitating flow in low specific speed centrifugal pumps and analysis of the NPSH characteristics and void structures

Dissertation zur Erlangung des Grades

Doktor-Ingenieur (Dr.-Ing.)

der Fakultät für Maschinenbau der Ruhr-Universität Bochum

von

Phillip Limbach

aus Herne

Bochum 2018

Dissertation eingereicht am:	07.06.2018
Tag der mündlichen Prüfung:	06.12.2018
Erstgutachter:	Prof. DrIng Romuald Skoda
Zweitgutachter:	Prof. DrIng Jens Friedrichs

Berichte aus der Strömungstechnik

Phillip Limbach

Numerical 3D simulation of unsteady cavitating flow in low specific speed centrifugal pumps and analysis of the NPSH characteristics and void structures

Acknowledgements

The following work has been created within my activities as a research assistant at the Chair of Hydraulic Fluid Machinery at the Ruhr-University Bochum. During this time, many people have contributed to the work and its success, whom I would like to address at this point.

First and foremost, I would like express my sincere thanks to my supervisor, Prof. Dr.-Ing. Romuald Skoda for his confidence he invested in me, giving me the opportunity for this Ph.D., and contributing significantly to its success. Thank you very much for creating a research environment with fruitful discussions and support, where I could develop my full potential.

Furthermore, I would like to thank Prof. Dr.-Ing. Jens Friedrichs for acting as co-examiner with a great interest in the subject, as well as Prof. Dr.-Ing. Martin Mönnigmann for accepting the chairmanship of the Ph.D. examination committee.

Next, I would like to thank Karoline Kowalski and Dr.-Ing. Tim Groß for providing a comprehensive amount of experimental data as well as for taking the time to discuss the results and experimental procedures. Moreover, I would like to thank the members of the working group 'Cavitation' of the VDMA Pumps&Systems for many discussions and helpful feedback.

Thanks to all my colleagues at the Chair of Hydraulic Fluid Machinery, who made the Ph.D. an enriching experience and for many interesting discussions, on and off topic. In particular, I would like to thank my friend and roommate Dr.-Ing. Stephan Mottyll for the supportive and positive atmosphere and very helpful discussions, at the office as well as in the evenings at the restaurants.

Last but not least, I am very grateful to Annalena and my parents, Rita and Ralf, who always supported me in every aspect and every stage of my life. Your unconditional tolerance and patience encouraged me and gave me strength and confidence.

Most parts of this work were financially supported by the VDMA e.V. and AiF e.V. within the IGF research project no.18015 N/1, as well as by the ministry of economics of North Rhine-Westphalia (NRW) in conjunction with EFRE for funding under contract 315-43-02/2-005-WFBO-011Z (Kompetenzzentrum Hydraulische Strömungsmaschinen). Furthermore, I am grateful to the Universities of Cologne, Aachen and Jülich for the grant of computing time on the Cheops Compute Cluster, RWTH Compute Cluster and JURECA Compute Cluster, respectively.
