Optimization of Hot Metal Temperature Prediction by Applying Continuous Hot Metal Temperature Measurement in Blast Furnace Thermal Control

Von der Fakultät für Georessourcen und Materialtechnik der
Rheinisch -Westfälischen Technischen Hochschule Aachen

zur Erlangung des akademischen Grades einer

Doktorin der Ingenieurwissenschaften

genehmigte Dissertation

vorgelegt von

Dipl.-Ing. Lijia Wu

Berichter: Univ.-Prof. Dr.-Ing. Dr. h. c. Dieter Georg Senk
Univ.-Prof. Dr.-Ing. Ulrich Epple
Univ.-Prof. Dr.-Ing. Elisabeth Clausen

Tag der mündlichen Prüfung: 06.10.2023

Diese Dissertation ist auf den Internetseiten der Universitätsbibliothek online verfügbar.

Acknowledgment

This present work is carried out when I am a production engineer in the ironmaking department at ROGESA Saar (Roheisengesellschaft Saar mbH).

First and foremost, I am highly grateful to Dr. Jean-Paul Simoes for giving me the opportunity to start this present work. Words cannot express my gratitude to him for his organization and tangible support of all the cooperation projects.

Furthermore, I would also like to express my most profound appreciation to my supervisor Univ.-Prof. Dr.-Ing. Dr. h.c. Dieter Senk for his dedicated support and guidance, particularly for his patience throughout this work.

Words cannot express my gratitude to Prof. Dr.-Ing. Ulrich Epple for his knowledge, expertise, and the valuable discussions from the process control point of view. These discussions inspired me new ideas for this work, especially for future work.

Special appreciation goes to Dr. Alexander Babich for the contribution of his experience and his expertise in technical discussions. In particular, words cannot express my gratitude for his patience and guidance in editing my papers.

I could not have undertaken this journey without the encouragement of Dr. Lin Rongshan. Many thanks for sharing his expertise and giving me constructive suggestions.

Additionally, this endeavor would not have been possible without the generous support from my superiors Dr. Jürgen Hochhaus and Dr. Frank Rullang. I appreciate them for giving me enough space and time to finish this work during daily business, allowing me to proceed with all the trails, and supplying all the resources needed during industrial trails.

Thanks should also go to colleagues from Paul Wurth Luxemburg, Pierre Van Dorpe and Micák Juraj, with whom we took the pyrometer successfully in commissioning, for their professional work. Moreover, I am also deeply thankful to Erik De Meyer from A.I.R.T. for sharing his expertise in pyrometer measurement.

The same gratitude should also be extended to Franck Giroldini and Xavier Roos from Paul Wurth Luxemburg for their great support in identifying the sources of error in the model's input data.

I would also like to thank Alexander Schmitz and Cédric Schockaert from Paul Wurth Luxemburg for their extraordinary contributions to establishing machine learning models. I am grateful for all the exciting and professional exchanges of machine learning techniques.

I am also thankful to Gabriel Montalto as a student assistant for his contribution to the success of applying the pyrometer. Moreover, the same thanks should be extended to Dr. Stephan Hojda from the R&D ironmaking department for all his efforts in supporting the contrast tests during pyrometer commissioning. I would also like to thank my colleague Dr. Geyer Richard for his kind help in correcting and improving my writing. Furthermore, I appreciate Dr. Feiterna Andreas for his efforts to help me get the permission from the company to publish this work.

I would be remiss not to mention the excellent support from all the employees of the ROGESA ironmaking department.

My greatest thanks go to my parents, Wu Xiaolin and Zhou Yan, for their love, unconditional trust, and tangible support throughout my life. It was their love that raised me again when I got weary. Without all these, I could not successfully finish my education in China and Germany.

Last but not least, I would like to express my sincere love to my husband Wang Jun, who is always my most enthusiastic cheerleader when I get frustrated. Words cannot express my gratitude for his complete understanding of my job. Without his support, I could not complete this work, so it only seems fitting that I dedicate this dissertation to him.

Abstract **1**
Zusammenfassung **3**
1 Introduction and objectives **5**
2 Literature review **7**
2.1 Blast furnace potential for CO_2 emission mitigation 7
2.2 Blast furnace process and thermal control 8
2.2.1 Blast furnace iron making process 9
2.2.2 Heat exchange and thermal control of the blast furnace 11
2.2.3 Criteria of blast furnace thermal state 13
2.3 Blast furnace mathematical models 21
2.3.1 Conventional balance-based model approach 21
2.3.2 Data-driven model approach for thermal state prediction 31
2.4 Rule-based blast furnace control system 45
2.5 Hot metal temperature measurement 47
2.5.1 Thermocouple 48
2.5.2 Pyrometer 49
3 Experimental work **55**
3.1 Relevant characteristics of industrial facilities and technology (ROGESA) .. 55
3.1.1 Blast furnace process monitoring and optimization system 56
3.1.2 Material charging and monitoring systems 57
3.1.3 Blowing and injection system and monitoring 60
3.1.4 Cast house layout and tapping strategy 64
3.2 Hot metal temperature measurement 67
3.2.1 Manual discrete and continuous thermocouple measurements 67
3.2.2 Location and commissioning of multi-wavelength pyrometer 70
3.3 Validation and results 73
3.3.1 Validation of continuous thermocouple measurement 73
3.3.2 Selection of trustable measurement 75
3.3.3 Validation of pyrometer measurement 83
3.3.4 Temperature profiles and patterns of pyrometer measurement 87
3.4 Discussion 90
4 Hot metal temperature prediction based on conventional balance-based model and the improvement using pyrometer measurements **93**

4.1 Hot metal temperature prediction based on conventional balance-based model 93
4.1.1 Description of mass and energy balance calculation 93
4.1.2 Correlation between hot metal temperature and Wu* at ROGESA 98
4.2 Results and discussion of improving hot metal temperature prediction based on conventional model 102
4.2.1 Evolution of $Wu*$ 102
4.2.2 Improving hot metal temperature prediction with results of pyrometer 107
5 Hot metal temperature prediction based on data-driven model with pyrometer measurement 112
5.1 Model establishing and description 112
5.1.1 Data preparation 112
5.1.2 Data selection and cleaning 113
5.1.3 Model selection 118
5.2 Model validation 121
5.2.1 Machine learning model with thermocouple lance measurement 121
5.2.2 Machine learning model with pyrometer measurement 123
5.3 Results and discussion 125
6 Overall discussion 131
6.1 Discussion 131
6.2 Outlook 136
6.2.1 Potential of further improvements on machine learning model 136
6.2.2 Ideas of establishing a rule-based model 138
6.2.3 Concept of thermal control recommendations 140
7 Summary 150
